

## MILESTONE FOR WEBAK

AUSTRIAN manufacturer Webak Games has reached a milestone in the development of its Dual Line Box for the double monitor cabinet.

It is, according to the company's Eveline Kreiner, a platform for the future and due to the available interfaces and output reserves the hardware is optimally equipped for the present software as well as future developments. "No matter which way we program, we are certain that we can rely on this technology for a long time to come," said Kreiner. The Dual Line Box will be introduced initially to the German and Romanian markets and versions for other countries will be available by request.

## BEACON OF LIGHT

ALBERICI has introduced a horizontal signpost topper - bringing together the functions of the traditional signpost toppers in one single frame.

It can be used as a light beacon to attract players and as a three-function pilot light to warn operators about the state of the machine e.g. stand-by, game in progress, winning stroke, service required and so on.

Made up of a three-window chassis, each window contains one light and both the chassis and window lenses are moulded in heat-resistant polymers. The chassis is available in black, chrome or white and the lenses can be provided clear, white or blue combining the chassis to offer various chromatic solutions.

The lenses can also be provided in three different colours such as green, yellow and red, each of which can relate to different operation or service conditions and intense light is produced by SMD-technology.

Another feature is that the unit works by 12Vdc, can be connected either to the Alberici RGB multi-colour toppers, meaning they will blink the same patterns as the topper lights do, or they can connect to the machine board, which will then control the lights in the LEM and relevant flashing pattern.

## GOLDEN RANGE FROM TAB AUSTRIA

Product Spotlight

TAB Austria's new gaming cabinet Golden Island Casino opens up new horizons for the gaming industry. The elegant cabinet with the intuitive design is the jewel in the crown of the new gaming platform Golden Island.

It reflects TAB's years of experience in the development of trend-setting touchscreen terminals and, according to the manufacturer, exceeds the requirements of modern gaming.

The innovative cabinet has extra-wide screens in the 16:10 format and is equipped with a high-resolution touchscreen.

The ergonomically designed area for controlling the games as well as the sound system with four loudspeakers and a subwoofer deliver maximum playing pleasure.

It is available with a coin acceptor, bank note reader or ticket printer and, as with all cabinets in the Golden Island range, the Casino cabinet can also be individually customised.

It also attracts players with its design and wide range of games, with the cabinet made entirely of metal and rounded off by chrome strips on the sides. A separate switch in the logic box allows a variety of configurations to be set up, providing a unique flexibility. Operators can organise their cabinets and adapt them to different requirements.

## DEALING WITH COMPATIBILITY

OVERCOMING many of the common problems of interfacing between different video games systems, is the new Delta 32 cabinet from RS Co of Japan, formerly River Service.

The cabinet, loaded with a 32ins LCD monitor and all of the accompanying software, is designed to take away most of the compatibility headaches between different systems and also has the flexibility to convert in seconds from horizontal to vertical displays by a simple revolution of the monitor.

The unit has already sold well in Japan and is now ready to enter the international market. A mother board system enables two players to compete through linked cabinets but with one of them housing only the monitor. The motherboard systems between different manufacturers is another problem which operators face as there are fine differences making them incompatible. This is one of the major areas which is corrected by the Delta 32 and now Sega, Taito and Namco are all interchangeable through the Delta 32.

RS has also taken away the complications of tiny differences between LCD monitors' different characteristics.
